

ABSTRACT

A computer implemented, web-based system and method of commerce for tracking the work flow activities of a project. For an on-line auction embodiment, the system includes a single web page showing the status of the sequence of procurement activities that must be completed in order to consummate the sale of the items
5 auctioned. Activities are displayed on the single web page in the planned order of completion showing the party responsible for the activity. The status of completion of each activity is indicated by a change in state of a visual indicator associated with each activity. In this manner the status of a plurality of transactions may be presented in an efficient and easily comprehended manner. Hyperlinks to additional web pages
10 may provide the user with additional information regarding the transactions.
